

The background features a gradient from deep red at the top to dark blue at the bottom, overlaid with faint, semi-transparent technical diagrams. These include circular gauges with numerical scales (e.g., 40, 150, 160, 170, 180, 190, 200, 220, 230, 240, 250, 260) and curved arrows indicating motion or flow. A subtle pattern of small white stars is also visible.

# OBJECT ORIENTED SOFTWARE ENGINEERING

**GOLDEN DRAGON HOT POT HOUSE RESTAURANT  
INFORMATION SYSTEM DESIGN**

INSTRUCTOR: MOHAMED KHAN

PROJECT DESIGNERS: JIAWEI (GERRY) WU, CHAO (FIONA) FENG, GORDON STEVENS

# WHAT IS "HOT POT"?

- Hot Pot (火锅 / 火鍋) is an Asian traditional way to serve a meal, originated from Inner Mongolia, China
- Sliced ingredients are brought to the table, where a shared pot is used to cook ingredients right at your table

# PROBLEM, NEED, AND SOLUTION

## Problem

Restaurant patrons want to visualize their meal before they order, and want to make the ordering process as fast and accurate as possible.

## Need

Restaurant information system to process orders and generate sales reports.

## Solution

Information system is proposed

# FIVE SUB-SYSTEMS

- Membership registration
- Ordering
- Payment
- Reporting
- Menu management

# RESTAURANT SETUP: AT THE TABLE

- The restaurant starts with an Apple iPad at each table, where customers can place an order for which ingredient dishes they would like to have.
- This is an all-you-can-eat restaurant.

# RESTAURANT SETUP: TABLE TO KITCHEN

After the order has been confirmed and paid for, the order goes to the kitchen on the kitchen food prep screen

# FOOD TO TABLE

- The wait staff brings the sliced food ingredients on serving plates to the table, ready for the customer to cook in the centre hot pot.
- The customer can leave reviews on the food and service, and reorder other foods from the Apple iPad.

# RESTAURANT SETUP: BACK-END

- Managers can receive sales reports, perform employee management, customize menus, etc.
- Managers use desktop and laptop computers to manage this

The system databases and back-end system run on Microsoft Azure Cloud, to reduce on-site hardware costs and to protect against possible hacking

# USER

- Customers
- Waiters
- Kitchen stuff
- Manager

# NOW FOR THE PLANNING!

## USER GOALS: CUSTOMERS

### Customer

**Sign up**

**View personal information**

**View menu and items**

**Order items**

**Cancel ordered items**

**Confirm order**

**View ordered items**

**Request bills**

**View bills**

**Provide feedback**

**View feedback**

# USER GOALS: WAITER

<u>Waiter</u>	<ul style="list-style-type: none"><li>View ordered items</li><li>View notification of prepared items</li><li>View bills</li><li>Confirm payment</li><li>View feedback</li></ul>
---------------	---

# USER GOALS: KITCHEN

<u>Kitchen</u>	<ul style="list-style-type: none"><li>View ordered items</li><li>Confirm prepared items</li></ul>
----------------	---

# USER GOALS: MANAGER

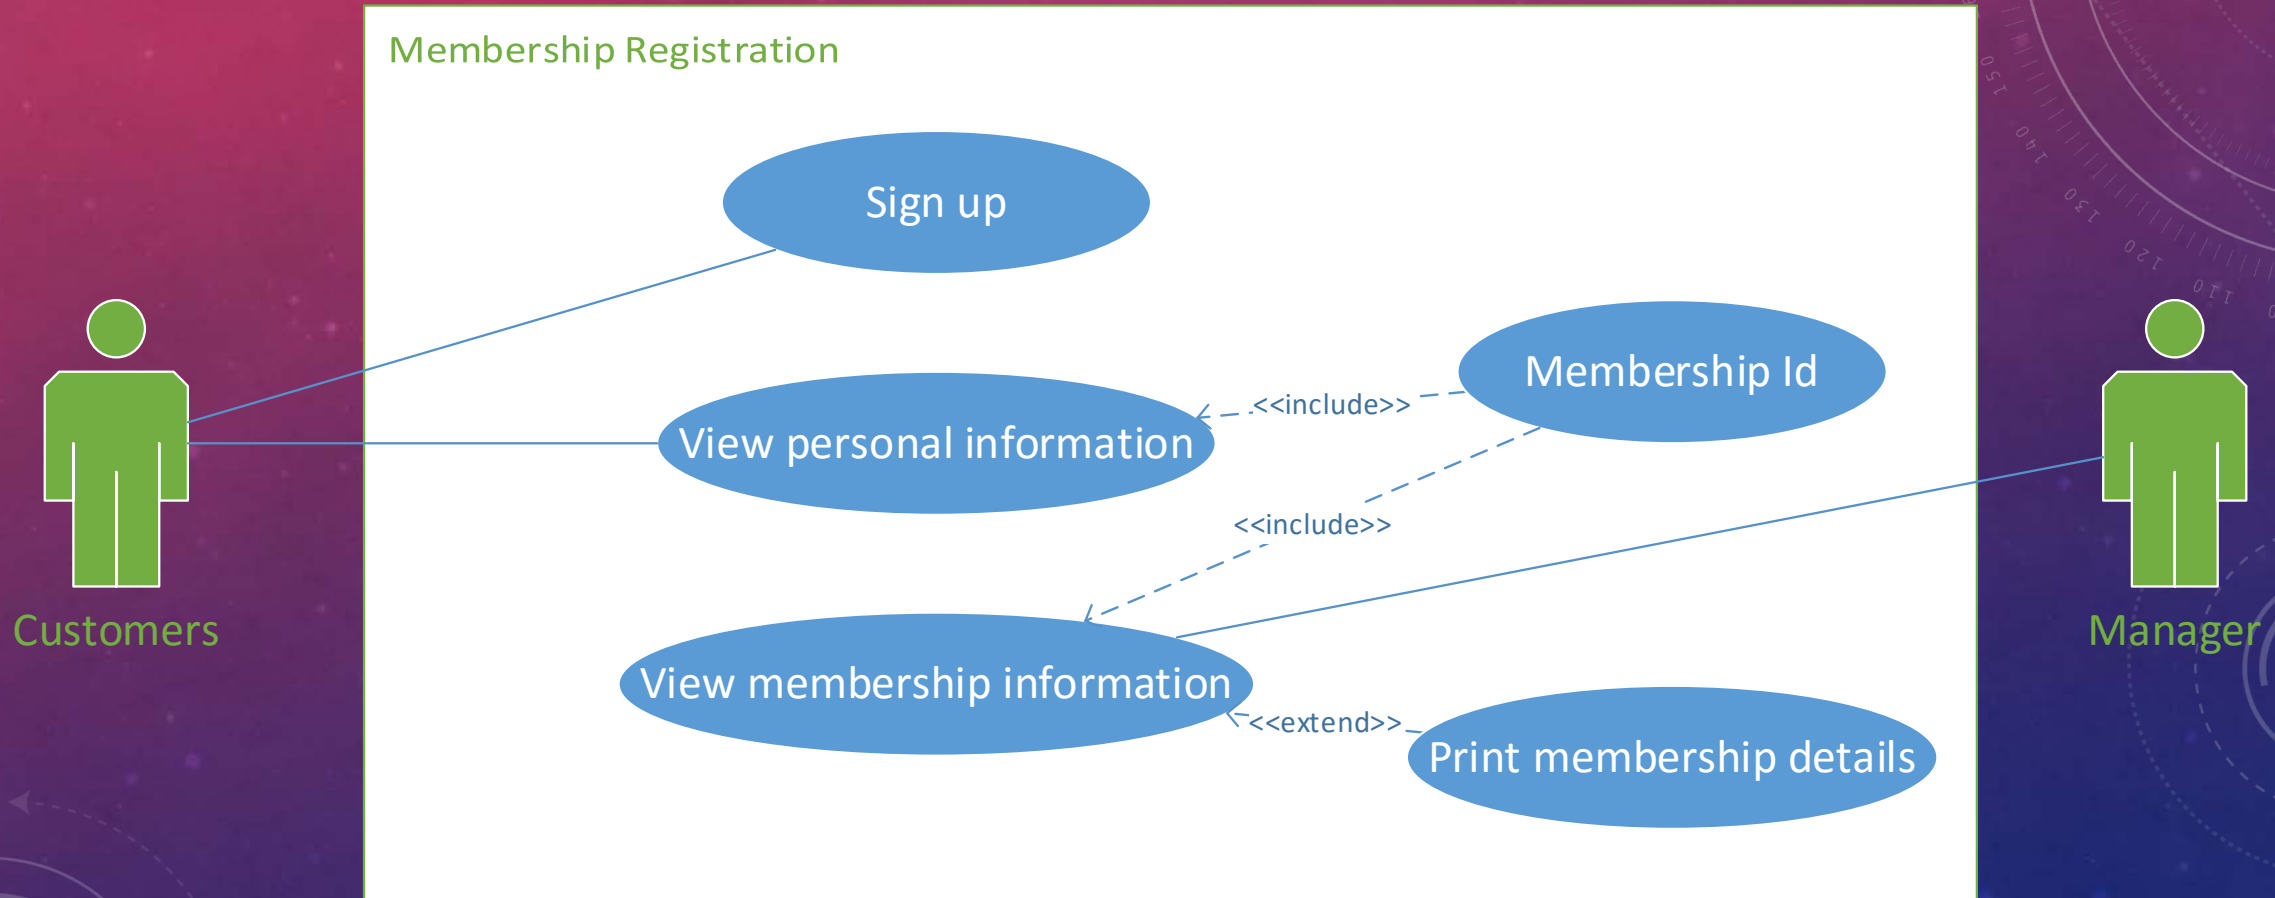

<b><u>Manager</u></b>	<b>View membership information</b> <b>View bills</b> <b>View feedbacks</b> <b>Require reports</b> <b>View reports</b> <b>Download reports</b> <b>Add menu items</b> <b>Modify menu items</b> <b>Delete menu items</b> <b>View Menu</b>
-----------------------	---

# SUBSYSTEM

- MEMBERSHIP REGISTRATION SUBSYSTEM
- ORDERING SUBSYSTEM
- PAYMENT SUBSYSTEM
- REPORTING SUBSYSTEM
- MENU MANAGEMENT SUBSYSTEM
